Measure Stability (Drift)

The MPP-EM2S+ is a useful geophysical instrument that will help you to get the information that you need to design an appropriate geophysical survey. In order to obtain stable values (which should be around 0) and avoid signal drift, **it is highly recommended to leave the probe ON during one hour before taking the first measurement.** After one hour, you must re-initialize the probe and then, you are ready to take measurements. To minimize the drift once you have started to take measurements, you must initialize the probe every 1, 5, 10 or 15 minutes. By default, the option 1 minute between every initialization is activated.

If you want to take measurements right away after turning on the probe, we suggest that you initialize the probe every minute or, for best results, before each reading for the first 30 to 60 minutes.

This preventive procedure decreases the risk to take erroneous values that would be caused by weather variations or by other external causes that lead to a drift of the instrument. It is therefore very important to often re-initialize in order to maintain the «0» base value used in the calculation of the displayed values.

Please take note that values are more stable after 20 minutes and are completely stable after 50 to 60 minutes.
Battery Discharge

*** It is recommended to put the handheld computer on charge when not in use to avoid discharge of the battery.

*** For the probe, when the level of the AA batteries charge is low, the value of the readings could be inaccurate and you could not be able to initialize the probe.

The specifications described in this Instructions Manual is valid at temperatures between 0°C and 70°C. At temperatures lower than 0°C, some specifications, like the batteries life, could be different.
Thank you for choosing the MPP-EM2S+ Multi Parameter Probe developed by Instrumentation GDD inc. to help you optimize your prospecting efforts. This probe will help you to better determine the nature, the exact position as well as the intensity of magnetic/conductive horizons along your cores and samples. The simplicity of the measurement process and the automatic recording will allow you to easily obtain conductivity and magnetic susceptibility profiles corresponding to the core.

Here are the key benefits of the new MPP-EM2S+ probe:

- It provides you the ability to measure at all time the magnetic susceptibility with or without the presence of a conductor such as pyrrhotite.

- It has improved software to measure in continuous mode using a time base with specific lengths of your choice.

- It is equipped with new software to quickly create a profile from the measurements taken in continuous mode.

Because the probe's response towards a conductor is similar to a conventional electromagnetic (EM) survey's response, it will provide you more significant information than an ohmmeter or a visual interpretation would do. To give an example, if the conductive zones of your core are evaluated by an ohmmeter, the occurrence of chalcopyrite will induce a reading corresponding to a conductive zone. In fact, chalcopyrite, even if it seems massive, will often not produce an anomaly detectable by an EM survey. Along the core, the MPP-EM2S+ probe will have a similar response as the EM response and will only indicate the conductors detectable by this type of survey. The use of the MPP-EM2S+ probe could, therefore, prevent you to beginning an EM survey campaign for a type of ore that would not respond to this approach.

In the previous example, the phenomenon that explains the absence of conductivity is probably related to the chalcopyrite ore distribution in the sample. If the chalcopyrite grains are not touching each other but are linked only by very thin filaments, the ohmmeter will detect the conductor presence because of these tiny filaments connecting them. However, the grains, being linked only by those filaments, will not form a sufficient surface to be detected by the probe.

For an equivalent content of conductive material, the probe’s response will be higher in function of the conductor's surface. You could try the following experience. Take an aluminium paper foil (a few cm²), put the probe on the sheet and note the intensity of the anomaly. Roll the sheet in a small ball, put the probe on the ball and take the reading again. You will see that the intensity of the anomaly is higher for a larger contact surface even if the substance conductivity and quality are the same.

**Pyrrhotite** often occurs in thin but continuous veins. It causes multiple and very high EM anomalies.

**Chalcopyrite** is hardly detectable for two reasons.

1. It is 20 times less conductive than pyrrhotite.

2. It occurs, more often, in disseminated grains or clusters rather than in continuous beds, as the pyrrhotite or graphite that extend in horizons of hundreds of meters.

**Pyrite and galena** are not conductive when they respond to an EM survey even within a single crystal. However, we have observed some very conductive samples of silver-bearing galena (Kamouraska) and pyrite rich in gold. (Balmorals and Wrightbar mines).

**Sphalerite, arsenopyrite and stibnite** are never conductive and are not detectable with EM and IP surveys.

**Rich graphite beds** can be more conductive than pyrrhotite. Occasionally they are not conductive at all. Graphite can also show all intermediary conductivity values.

It is important to note that, with or without the presence of a conductor such as pyrrhotite, the MPP-EM2S+ probe will measure the magnetic susceptibility value.

At all times, the MPP-EM2S+ provides an estimated EM conductivity value.
3. Equipment List

When receiving a GDD MPP probe, model MPP-EM2S+, ensure that its contains the following elements:

The items supplied with the device and available accessories may differ from the picture.

1. One (1) MPP-EM2S+ wireless probe
2. Four (4) rechargeable AA batteries with charger
3. One (1) wall power supply with international adapters
4. One (1) standard serial communication cable
5. One (1) USB / serial cable adapter
6. One (1) Master USB cable with DC jack
7. One (1) SoMo 650M handheld computer with full size stylus and its case
8. One (1) desktop synchronization cradle
9. One (1) Somo USB communication cable
10. Two (2) Somo Li-Ion rechargeable batteries with their cover
11. One (1) Somo charger with international adapters
12. One (1) MPP Instruction Manual
13. One (1) MPP utilities CD-ROM/USB Stick
14. One (1) black carrying case
15. One (1) Belt carrying case

Not shown on the picture:
One (1) Somo User documentation
One (1) Audio headset with microphone with one (1) 2.5mm to 3.5mm headset adapter
One (1) Rebooting card

Do not hesitate to communicate with GDD Instrumentation Inc. if needed.
4. Batteries

4.1 Handheld computer batteries

It is strongly recommended that you always keep a charged battery within the handheld computer. If the main battery loses its charge, unsaved data can be retained for only 5 minutes. After this time, unsaved changes in files you were working on may not be saved.

*** It is therefore suggested that you put the handheld computer on charge when not in use to avoid discharge of the Li-ion batteries.

To check the remaining battery supply, **Turn on** the Somo 650-M PDA, go to **Start** menu and select **Settings**. Click on the **System** tab at the bottom of the screen. Click on the **Power Plus** icon to open the power settings. Please note that it may take a few seconds (sometimes up to one minute) to refresh the remaining battery supply.

We recommend the following steps:

- Make sure that the main battery is full. Recharge it if necessary. **Removing either AC power or the main battery for greater than 5 minutes could result in the SoMo failing to power on after changing the battery.**

- In the **ADVANCED** tab at the bottom of the screen, uncheck the «**Turn off device if not used for...**» case.

- Tap OK in the upper right corner once you have finished. You will be brought back to the system settings window.
4.2 Supplying power to the probe

With the MPP 1000 Series, it is possible to use three AA batteries or the wall power supply included with the MPP set.

*** The use of another power supply than the one provided by GDD could damage the probe.

4.3 Battery level indicator

If the power of the probe is supplied by three AA batteries, it is important to verify that the level of the batteries charge is sufficient.

Press and hold the BI button to turn on the lights.
**Lights signification**

** This information is an approximation only. The time remained depends of the type of cells and the operating conditions.

### 4.4 Recharging AA batteries

Simply put the AA batteries in the charger and plug it in the wall using the 120 V plug located at the back of the charger or the 220 V adapter.

![Picture 1](image1.png) ![Picture 2](image2.png) ![Picture 3](image3.png)

### 4.5 Recharging Li-ion batteries

The Li-ion batteries can be recharged with the charger plugged in the handheld computer (picture 1) or with the charger plugged in the USB communication cable (picture 2) or with the desktop synchronization cradle and charger (picture 3). With the cradle, both Li-ion batteries can be recharged at the same time.
5. Probe buttons and switches

5.1 On / Off Switch

Turn on the probe with the On / Off toggle switch.

5.2 Cable / Wireless / Prog Switch

The Cable / Wireless / Prog. switch is used to select the operating mode.

*** It is important to place the switch in the position wanted before turning the probe on.

The Cable and Wireless positions are used to operate with or without cable. The Prog position is not used for normal operation. If the operating mode must be changed during the operation, the probe must be turned off before changing it.
5.3 STAMP and MEM buttons

There are two buttons on the handle of the MPP–EMS2+ probe. These buttons have the same utility as the STAMP and MEMORY keys in the handheld computer and were designed to facilitate handling. See Section 11 – Reading Modes for more details.

5.4 BI button

See Section 4.3 – Battery level indicator to know how to use this button.
6. Handheld computer characteristics

If you have any question regarding the handheld computer characteristics, you can refer to the handheld computer’s Quick Start Guide.

It is recommended to read all the sections of the handheld computer’s Quick Start Guide to learn about many other useful characteristics and facilities of the unit.

Here are a few suggested settings:

Go to the Start menu, and select Settings. Choose the System tab at the bottom of the screen. Click on Backlight icon.

Backlight:

In the BATTERY POWER tab, uncheck the «Turn off backlight if device is not used for ...» button.

In the EXTERNAL POWER tab, also uncheck the «Turn off backlight if device is not used for ...» button.

In the Configure tab, put both battery power and external power to the highest brightness.
Go back to the **Settings** window (tap OK in the upper right corner) and click on **Clock & Alarms** icon.

**Clock:** Set it to the right time and date. **The time and date displayed in the data file saved with the MPP program are those of the handheld computer.**

Go back to the **Settings** window (tap OK in the upper right corner) and click on **Hold Switch** icon.

**Hold Switch:** select **Disable auto-suspend.**

To select the items that will appear in the **Start** menu, go back to the **Settings** window, click on the **Personal** tab and click on the **Menus** icon. Many items will be checked. We suggest that you remove all ticks on the **Menus** settings except **ActivSync, File Explorer, MPP_en.**
7. Quick Start

1. Insert three fully charged AA batteries into the probe and a fully charged Li-ion battery into the handheld computer. *(Section 4 – Batteries)*

2. Place the Cable / Wireless / Prog Switch on Wireless position. *(Section 5.2 – Cable / Wireless / Prog Switch)*

3. Turn on the probe and the handheld computer. *(Sections 5.1 – ON/OFF Switch and 6 – Handheld computer characteristics)*

4. Start the **MPP_en** program and select the Bluetooth mode.

5. Enter the sample diameter or select the Wall option for a flat surface and click Confirm.

6. Move away the probe from any conductive or magnetic material (point it in the air) and click in the GDD logo space to initialize.

7. Configure parameters, i.e. file name, spacing, mode, etc. *(Section 10 – Setting parameters)*

8. Take and record readings. *(Section 11 – Reading modes)*

9. Create a file to save readings. *(Section 10.4 - Memory)*

10. Transfer the file to your computer using the USB cable. *(Section 12 – Software installation et file transfer).*
8. Starting

8.1 Starting– Wireless (Bluetooth) mode

*** It is highly recommended to leave the probe ON during one hour before taking the first measurement.

1. Put a fully charged Li-ion rechargeable battery into the handheld computer and slide the battery cover back into place. Do not press the battery cover directly down or the battery door sensing switch could be damaged.

   It should be able to work over 7 hours.

2. Turn and pull the cap of the battery holder, and insert 3 AA batteries into the probe. Push and turn the cap to close it. Or, plug the wall external power supply in the power jack.

3. Place the Cable – Wireless – Prog switch in Wireless position.
4. Turn on the probe with the On/Off switch placed on the right side of the probe.

5. Turn on the handheld computer with the button at the top.

6. Run the MPP program by selecting MPP_en in the Start menu. Use the stylus provided with the handheld computer or your finger to avoid damaging the screen.

7. Select Bluetooth mode.
8. Enter the sample diameter or select the ‘Wall’ option for a flat surface. Click on Confirm.

9. Set the different parameters you need to use (see Section 10 – Setting parameters) according to the reading mode you chose (see Section 11 – Reading modes). Once the setting is finished, come back to the GDD logo screen, keep the end of the probe far from metal objects (point it towards the sky) and initialize it by tapping on the GDD logo.

10. The INITIALIZATION message should flash for few seconds and after this, the reading screen should appear. You are ready to take readings according to the reading mode you chose (see Section 11 – Reading modes).

*** If the INITIALIZATION message still appears, see Section 17 – Troubleshooting.***
8.2 Starting – Cable mode

*** Use the cable mode only if the Wireless (Bluetooth) mode does not work.

Connect the serial RS-232 cable with the adapters between the probe and the handheld computer.

![Image of cable connection](image)

Note: You need to plug together three cables to make a serial (RS-232) communication.

1. One (1) standard serial communication cable
2. One (1) USB / serial cable adapter
3. One (1) Master USB cable

*** The driver for the USB/serial adapter is already installed in the handheld computer. If the green light on the USB/serial adapter does not turn on when the serial communication cable is connected between the MPP probe and the handheld computer, contact Instrumentation GDD Inc. technical support.

The steps for the Cable mode are the same than those of the Wireless mode (Section 8.1 - Starting–Wireless mode) except steps 3 and 7.

At step 3, the Cable – Wireless – Prog switch must be in Cable position.
At step 7, select the RS-232 mode.
9. Display

The main screen displays three sections: The menu bar (1), the displayed measurements (2) and the memory space (3).

Several times per second, the probe measures and displays three physical properties which are:

**HF RESPONSE**: Conductor response measured in Hertz (Hz). It measures high frequency variations. Its value increases with the quantity of conductive material in the sample. It decreases with the distance between the probe and the sample.

**SCPT 0.001 SI**: Magnetic susceptibility is a constant (x10^{-3}). SI = International system of units. Its value increases with the quantity of magnetite in the sample and decreases with the distance between the probe and the sample. It is important to note that, with or without the presence of a conductor, the MPP-EM2S+ probe will measure the magnetic susceptibility value at all times.

**COND MHOS/M**: Conductivity measured in MHOS/M. It is independent on the quantity of conductive material in the sample (HF Response) and independent on the distance between the probe and the sample.

Under the measures you can find a space reserved for the samples or core identification (Identification). The MEMORY space indicates how many readings have been taken and the DEPTH value (position along the core) of the measure to come.
10. Setting parameters

To set the parameters of the reading modes, click on the CFG menu of the main screen. In this menu, it is possible to set Reading, Sound, Reinit, Memory and Diameter parameters.

10.1 Reading

1: Identification

This field allows you to identify your reading series. Click on the keyboard icon to enter the name you want.
2: Spacing

This parameter sets the distance between two readings. If the readings are taken with regular spacing, only one entry is needed. You can enter up to three distances, one for each of the three boxes. If the spacing is different at each reading, it is also possible to set the distance manually (see Section 11 – Reading modes). In this case, enter 0 into each of the three Sp. boxes.

3: Depth

This parameter indicates the depth of the first reading. The depth will increase after each reading following the spacing set.

4: Unit

Select the right measuring unit of the spacing and depth parameters.

5: Recording frequency

Use this setting only if you need to work in continuous mode (see Section 11.2 – Continuous mode). The time selected represents the time between two readings.

10.2 Sound

This sound is the one you hear when a conductive material is detected. If the box is selected, the sound is enabled. You can set a threshold detection value for the HF RESPONSE. For values higher than threshold, the instrument will beep. The default threshold is set to 300.

The sign # appears in the Memory space of the main screen of the program if the sound is disabled.
10.3 REINIT page

The initialization is the operation that restores the readings to zero.

![Initialization screen](image)

1: **Initialization time**

   *Remember: it takes at least 40 minutes for the probe to warm-up.* Before that time is reached, you need to initialize the probe every minute or before each reading. After the probe is ready, it is possible to set the time between two initializations. The default time is one minute. Otherwise, you could also set the time for either 5, 10 or 15 minutes. The new time set will be activated after the next initialization.

   ***You will not be able to take measurements if you do not initialize the probe 30 seconds after the software asks you to do it.***

2: **Active Screen**

   You must select the Active Screen box. This function enables the touchscreen function of the handheld computer. It is required to initialize the probe when the software asks it.
10.4 Memory

To be able to download the recorded readings in your personal computer, a file must be created with the readings. This step is done with the Memory page. The Memory parameters are set at the end of the process (when the readings are recorded).

1: Identification

If you have already entered a name for your readings series in the Reading page, it will appear in this field. If not, you can enter a new name. The name entered in this field will be the same as the created file. The .txt extension must still be written at the end of the name.

2: Memory range

By default, this range contents all the recorded readings. It is possible to select only a little section of the entire range to create the file. The numbers indicate the number of each memory and not the depth of each reading. If the Range Error message appears, check if the numbers of the memories you selected are existing.

3: Repartition

The Repartition case must be checked only if you use continuous mode. This will distribute the readings equally between the marked positions (Stamps) in the dumped file. Checking the Repartition case when using the manual mode could cause erroneous positions in the dumped file.
4: File creation

Start the file creation by clicking the **File Creation** button. Make sure that you correctly set the Identification and Memory range parameters before starting the file creation. If the file is created after many hours of operation (with a lot of recorded readings), it is possible that the file will take up to twenty minutes to be created. The message *File complete* will appear. See following images to find the created file:

![Image 1](image1.png) ![Image 2](image2.png) ![Image 3](image3.png)

See *Section 12 – Software installation and file transfer* to know how to transfer a file from the handheld computer to a desktop computer.

5: Clear memory

After the file creation process, restore the readings recorder to zero by clicking the Clear memory button. Before doing that, make sure that the file is well created. A *Confirmation* message appears when the Clear memory button is clicked to prevent errors. If the memories are not cleared, the next recorded readings will be added to the readings still in the memory.
10.5 Diameter

1: Diameter or Wall button

If you are scanning a core sample, select the Diameter option. For a flat surface, select the Wall option.

2: Diameter

Enter the core sample diameter in millimeters in this field if the Diameter option is selected.

3: Half Sample checkbox

Check this case if you are scanning a split core sample.
11. Reading modes

In this section, the settings mentioned are those in Section 10 – Setting parameters.

It is possible to take readings by using four different methods with the MPP-EM2S+. These methods are manual, continuous, graphic and single reading modes.

11.1 Manual mode

Needed settings (Reading page in the configuration-CFG menu): Spacing, Depth, Unit.

How to use:
1: **Spacing button**

This button indicates the activated spacing. If more than one spacing has been configured in the three boxes of the parameter (Section 10.1), it is possible to switch between the spacings by clicking on this button.

2: **Depth field**

This field shows the depth where the next reading must be taken. For irregular distances between the readings, it is possible to set the distance manually before each reading by writing the depth in this field by using the keyboard. You have to confirm the new entry by clicking on the OK button at the right of the Depth field.

3: **Memory space**

To record a reading, click on this space or push the MEM button of the probe. The depth shown in Depth field will increase according with the spacing shown in the spacing button after each time the Memory space or button is clicked.

4: **Readings space**

This space shows the values of the readings. If the values increase by themselves (without measurements), initialize the probe to restore the values to zero before taking a new reading (drift - see Warnings at the beginning of this Guide). For more details about the signification of the readings, see Section 13.

5: **Back button**

This button allows the user to erase the last value recorded. It is possible to erase all readings recorded one after another by clicking on this button. A *Confirmation* message appears when this button is clicked to prevent error.
6: PLEASE INIT message

By default, this message appears every minute. When it appears, a probe initialization is required. If the probe is not initialized after 30 seconds, the GDD logo with the message PLEASE INITIALIZE will appear and the readings will stop. The readings will resume when the probe will be initialized (you just need to press the readings space). It is possible to change the time between two initializations in the REINIT page (see Section 10.3). If you are not able to initialize the probe when you see the GDD logo, you will need to close the software and open it again.

7: PROBE LOW BAT message

This message indicates that the charge of the AA batteries is not sufficient to supply the probe. The batteries must be replaced or recharged. **When the level of the batteries charge is low, the value of the readings could be inaccurate.**

Recommendations:

- Make sure that the contact between the core sample and the end of the probe is the same for each reading you take. Otherwise, you will obtain different values if you repeat your reading with a different angle or a different position of a couple of millimetres (see Section 13 - Reading interpretation).

- Create a file after each reading series. (See Section 10.4 – Memory page).
11.2 Continuous mode

In this mode, the readings are recorded automatically according to the recording frequency you need (every second, every five seconds, etc.). Marking different positions along the core sample will help you to have a more accurate graphic.

Needed settings (Reading page in the configuration-CFG menu):

Space, Depth, Unit, Recording frequency.

How to use:

1: Spacing button

This button indicates the activated spacing. If more than one spacing has been configured in the three boxes of the parameter (Section 10.1), it is possible to switch between the spacings by clicking on this button.

2: Depth field

This field shows the depth where the next point must be marked (stamp button). For irregular distances between the readings, it is possible to set the distance manually before each marking by writing the depth in this field by using the keyboard. You have to confirm the new entry by clicking on the OK button at the right of the Depth field.
3: Memory space

The readings are recorded automatically according to the recording frequency (Reading page in the configuration-CFG menu) you need (every second, every five seconds, etc.). To start the recording, click on this space or push the MEM button of the probe. Use the same way to stop the recording. The MEM button is not used to record one reading at a time in this mode. When the recording is activated, the Stamp bar turns to green and a REC message appears with the number of memories.

4: STAMP bar

The STAMP bar is red when the recording is disabled and green when it is enabled. Use this bar or the STAMP button of the probe to mark a position. The positions marked will allow you to create a graph with your data on your personal computer. The more marks that you have, more accurate the graph will be.

5: Readings space

This space shows the values of the readings. In this mode, it is highly recommended to wait about 40 minutes to let the probe warming-up before starting to take readings (drift - see Warnings at the beginning of this Guide). Otherwise, you will have to initialize the probe to restore the values to zero before taking each reading, and initializing the probe will stop the recording. You will have to restart the recording after each initialization. For more details about the signification of the readings, see Section 13.

6: Back button

This button allows the user to erase the last recording. It is possible to erase all readings recorded one after another by clicking on this button. A Confirmation message appears when this button is clicked to prevent error.
7: **PLEASE INIT message**

By default, this message appears every minute. When it appears, a probe initialization is required. If the probe is not initialized after 30 seconds, the GDD logo with the message PLEASE INITIALIZE will appear and the readings will stop. The readings will resume when the probe will be initialized (you just need to press the readings space). It is possible to change the time between two initializations in the REINIT page (see Section 10.3). If you are not able to initialize the probe when you see the GDD logo, you will need to close the software and open it again.

8: **PROBE LOW BAT message**

This message indicates that the charge of the AA batteries is not sufficient to supply the probe. The batteries must be replaced or recharged. *When the level of the batteries charge is low, the value of the readings could be inaccurate.*

**Recommendations:**

- Keep a constant speed to move the probe along the core sample to obtain a real graph, and make sure that the contact between the core and the end of the probe is the same for each reading you take.

- If the conductivity of some points on the core seems to be very high (999999), check if this conductivity is true by reading again slowly the conductivity of these points with the MPP probe.

- Create a file after each readings series. *(See Section 10.4 – Memory page).*
11.3 Graph mode

The graph mode allows you to visualize the readings graphically in real time. The curves of HF Response, magnetic susceptibility and conductivity are shown simultaneously. In this mode you cannot record data.

1: Vertical axis

This axis has a logarithmic scale (from 0 to 100 000). The axis units are Hertz and MHOS/M. The magnetic susceptibility has no unit but the values shown are $10^3$ times higher than the real values.

2: Horizontal axis

This axis has a time scale. The curves appear according to the motion of the probe on the core sample.

3: Curves

- HF response: red (Hertz)
- Magnetic susceptibility: green ($10^{-3}$ SI)
- Conductivity: blue (Mhos/m)

4: CONFIG button

This button allows you to set the parameters of the graphic mode. These parameters are the sampling frequency, the horizontal axis scale and the width of the lines draft on the graph.
The sampling frequency can be selected from 0.1 to 5 seconds. For example, the reading will appear on the graph each 0.1 second if you have selected 0.1s.

The value of the X scale is absolute from 1 to 5. This will set the speed that the graph will appear with. A value of 5 represents a longer distance between two readings on the graph; the graph will appear faster. The default value for the X scale is 3. This parameter is just a visualization setting; the graph will be the same whatever the value selected. It will just come up with a different speed on the screen.

The Line Size is the width of the lines draft on the graph. The default value is 1, the maximum size is 5. This parameter is just a visualization setting.

5: INIT button

This button allows you to initialize the probe before taking readings.

6: START button

Tap on this button to start the graph. When the graph is activated, the menus bar will become green. To see the readings on the graph, move the probe along the core samples as for the continuous mode. The readings will appear in real time at the right of the screen.

To disable the graph mode, click on STOP button (the START button will become the STOP button after the graph will be activated). During this process, when the PLEASE INIT message appears, keep the end of the probe far from metal objects and click on INIT button. To record the values, you must press the MEM button on the probe.
11.4 Single Reading mode

The single reading mode initializes the probe and allows taking a single reading. After the probe is initialized, you have 15 seconds to take a reading before you have to reinitialize the probe. The reading values will be displayed on the screen with a resolution of $10^{-6}$ SI for readings lower than $10 \times 10^{3}$ SI. The reading will remain there until the probe is initialized again.

1. **Single reading Mode**

   A check will appear next to this option if it is active.

2. **Display**

   The reading display is frozen in this mode. If “-----” is shown in the fields, the probe is initialized and is ready to take a reading.
3. **Readings space (Initialization)**

   Pressing the GDD Logo or the readings space will initialize the probe and start the 05 seconds timer. Touching the readings space again will reinitialize the probe and reset the 05 seconds timer.

4. **Memory button**

   Pressing the Memory space on the PDA or push the MEM button on the probe for the first time will initialize the probe. A beep is emitted when the initialization is done. Pressing the Memory space on the PDA or push the MEM button on the probe again will take a reading and store it in memory. A beep will confirm that the reading has been saved.

   **Steps: how using this mode**

   1. Select Single Reading from the CFG menu to activate this mode.
        
        ![CFG menu](image)

        2. Move the end of the probe far from metal objects and initialize it by taping on the GDD logo or on the MEM button of the probe.

        ![Probe initialization](image)
3. When “-----” appears, position the probe on the sample and press the MEM button to take a reading.

4. Repeat steps 2 and 3 to take several readings.

5. When done, select Single Reading from the CFG menu to deactivate this mode.
12. Software installation and file transfer

In order to establish communication between the PDA and a desktop PC, you need to install the appropriate synchronisation software.

Windows 10, 8, 7 or Vista 64 bits users will require Windows Mobile Device Center 64 bits while Windows 10, 7 or Vista 32 bits users will need to install Windows Mobile Device Center 32 bits. Refer to the “Sync PDA on Windows 10.pdf” document located on the CD-ROM/USB stick if your experience problems using Windows 10.

Install ActiveSync if you run Windows XP or earlier.

Another way of transferring data between your Somo and your PC is to use a SD card. Refer to the detailed sections below.

It is possible to download the free software directly on Microsoft web site.

12.1 ActiveSync Installation

1. Once ActiveSync is installed, a gray icon will appear in the bottom right corner of your desktop PC screen.

2. Right click on the ActiveSync icon to open the Microsoft ActiveSync and select Connection Settings...
3. Check *Allow USB connection with this desktop computer.*

![Connection Settings](image)

**12.2 Windows Mobile Device Center Installation**

1. Once Windows Mobile Device Center 32 or 64 bits is installed, click the Windows Start Menu icon and then click *All Programs* to display all installed programs. Click *Windows mobile Device Center* to launch the application.

![Start Menu](image)

![Programs](image)
Under *Mobile Device Settings* option, click on *Connection settings.*

2. Check *Allow USB connections*

4. To establish connection with a desktop PC, connect the micro USB cable between the Somo and the desktop PC.

5. Turn the PDA *ON.*
12.3 Connecting the handheld computer with a desktop PC

1. Connect the USB cable to your desktop computer.

2. Put the handheld computer on its USB desktop synchronization cradle.

3. Turn on the handheld computer.

4. The desktop ActiveSync icon is now green.

OR the Windows Mobile Device Center application will connect with the PDA.

5. A small PCLink icon appears on the handheld computer taskbar.
12.4 Transferring file(s) from the pocket computer to a desktop PC

1. Double click on the *My Computer* icon on your desktop PC *with ActiveSync*.

   ![My Computer](image1)

   From the **Windows Mobile Device Center**, click *Connect without setting up your device*.

2. Double click on the *Mobile Device* icon *with ActiveSync*.

   ![Mobile Device](image2)
With **Windows Mobile Device Center**, click *Browse the content of your device under the File Management section.*

3. The MPP folder contains the file(s) saved with the MPP software.

4. Use the drag and drop or cut, copy paste functions to move file(s) between your handheld computer and your desktop PC. The data file is named: File_Name.txt.

5. Open the saved files with Notepad or Excel.
12.5 Transfer the data using a SD card

The Somo is equipped with a SD slot located in the top compartment. To insert or remove a card, refer to the picture below:

If your computer is equipped with a SD slot you will be able to transfer files from your MPP probe to your computer. Ensure that the MPP files are saved or copied to the SD card first. It is also possible to use the SD card to update your software.

*** It is not recommended to use the Rebooting card for data transfer ***
13. Readings interpretation

13.1 HF/Cond Distinction

In the case of conductive sulphides: The HF response provides an indication of sulphides quantity. The Conductivity (Mhos/m) provides an indication of sulphides quality. The conductivity of a small and a large aluminium foil will be similar but the HF response will increase with the size of the aluminium surface.

13.2 Results Signification

**HF RESPONSE**: the number in this window represents the value of the HF response.

**SCPT 0.001 Magnetic Susceptibility**: the number in this window represents the value of the magnetic susceptibility. As mentioned previously, it is important to note that, in the presence of a conductor, the MPP-EM2S+ probe will measure the magnetic susceptibility value. In the presence of pyrrhotite combined with a small amount of magnetite or no magnetite at all, the magnetic susceptibility will be measured.

**COND MHOS/M Calculated Conductivity**: it is important to note that in the presence of some magnetite in the sample, the MPP-EM2S+ probe will overestimate the conductivity value. The « > » sign appearing before conductivity value indicates that real conductivity is higher than 999999. It is recommended to take the measurement again on the points marked with > or where the value is 999 999 after reinitializing to make sure that the readings are real.

13.3 Sample Shape and Distance

The measured values could depend on the shape of the sample. For an equivalent content of conductive/magnetic ore, the response will increase with an increasing surface of contact. In the same way, the response will decrease with an increasing distance between the probe and the sample, the probe has to be in contact with the sample.
14. How to re-install GDD MPP Software

If the MPP software is accidentally erased from the handheld computer, it is possible to re-install it from MPP Utilities CD-ROM/USB stick.

It is possible to do this the same way as described in Section 15 – Software update installation using the MPP Utilities CD-ROM/USB stick (instead of GDD web site).

After the re-installation, if the software name MPP_en does not appear in the Start menu, select Settings in the Start menu, click on Menus icon and tick off MPP_en in the list.
You can always check if the software installed in your module corresponds to the last update by clicking on Version in the Help menu of the MPP_en software. The number of the actual version will appear. The latest version is 1.2.10.10 (except for the probes MP90XX or S95XX). Contact GDD for more information about the latest version of software.

If you are advised that a new update is available on the Internet (at www.gdd.ca), follow these instructions:

1. Install the handheld computer in its charger support (cradle).

2. Plug your handheld computer to the PC with the cradle USB cable. The software must be installed on your computer (see Section 12 – Software installation and File transfer).

3. The connection should be established automatically. If applicable, click on the little ActiveSync icon in the lower corner on the right of the PC screen, and select Connection Settings.... The settings must be as shown below:

   ![Connection Settings Window]

   Click on the Connect... button.

4. When connected, the ActiveSync icon turns green.

5. Click on My Computer icon on the desktop of your PC.

6. Open Mobile Device corresponding to the hardware of the handheld computer.
7. Copy the software update from a CD or a file (file with the .cab extension) to **SoMo File Store** directory. The update will be transferred to your module.

8. When the transfer is done, open the **Start** menu of the module.

9. Chose **File Explorer**.

10. Go to **SoMo File Store** and click on the update file (.cab file).

11. The program will ask you if you really want to install the new MPP software. Answer **yes**. The update software will be installed automatically. If the program asks you if you want to continue even if the software comes from an unknown publisher, answer **yes**. You can now use the MPP system and log your core.

If, for any reason, the upgrade does not work, you may always go back and re-install the software from the original MPP Utilities CD-ROM/USB stick.
Open the Microsoft Excel software.

In the tool bar, select File and Open.

In Type of files, select All Files (*.*) In Look in, you have to localize your file. This is very important in order to find the file you need. The file extension is .txt. Then select the file you want to open and click on Open.

You should now see Text Import Wizard – Step 1 of 3. Select Fixed width. Select Next.

Text Import Wizard – Step 2 of 3.

Text Import Wizard – Step 3 of 3.
Make sure that break lines separate the following titles: **U** (position 35-37), **SYM** (position 37-41) and **SYM** (position 53-57). Select **Next**.

**Text Import Wizard – Step 3 of 3. Select Finish.**

![Text Import Wizard](image)

It is very important that you save your file at this point. To do so, go to the tool bar and select: **File**, **Save as**: In the **Save in**: field, choose the folder in which you want to save it. In the **Save as type**: field, select Microsoft Excel Workbook (*.xls). In the **File name** field, choose the name you want to save. Click on **Save** button.
17. Troubleshooting

17.1 Errors while starting the MPP software

➤ **Problem:**

In Bluetooth mode, a COM Error message appears:

![Error Message](image)

**Solutions:**

- Look at the Bluetooth icon of the handheld computer screen.

![Bluetooth Action](image)

If it is Off, click on it and click on Bluetooth bar in the Wireless Manager window. It should change from Off to Visible or On.

If a message telling that the “driver memory space is not sufficient” appears, perform a Soft Reset on the handheld computer before turning Bluetooth on.
Try again to start the MPP_en software.

- The **Cable / Wireless / Prog.** switch must be in **Wireless** position and the probe must be **ON**. The selected position of the **Cable / Wireless / Prog.** switch must be in place before turning the probe on.

- Check if AA batteries are sufficiently charged by pushing on the BI button of the probe. If no lights are on or if only the red light is on, replace the batteries or use the external power supply provided by GDD. The Bluetooth mode requires more power than the Cable mode.

- Check if a Bluetooth Partnership has been established between the handheld computer and the probe (see Section 18.3 – Bluetooth Partnership).

**Problem:**
During the initialization, **INITIALIZATION** message still remains on the screen.

**Solutions:**
- In **Cable** operating mode, check if the RS-232 cable is correctly connected. Make sure that the green LED of the USB/serial adapter is on. If the LED is off, contact Instrumentation GDD Inc. Technical support.

- In **Cable** operating mode, if Bluetooth option is available, check if the selected position of the **Cable / Wireless / Prog.** switch is **Cable**. The selected position of the **Cable / Wireless / Prog.** switch must be in place before turning the probe on.
• In Bluetooth operating mode, check if the RS-232 cable is not connected between the probe and the handheld computer.

• In Bluetooth operating mode, check if a Bluetooth Incoming Port (COM1 to COM9) has been configured. This Incoming Port could be in conflict with the Port used by your MPP probe. The Incoming Port (COM0) should not cause any problem.

![Bluetooth Settings](image)

Click and hold the configured Incoming Port until a little menu appears. Select Delete.

![Delete Incoming Port](image)

• Check if the probe is ON.

• Make sure that AA batteries are sufficiently charged. The Initialization process requires much power. If the probe batteries are not fully charged, the program will not be able to initialize.
➢ **Problem:**

The handheld computer does not turn on anymore.

✓ **Solution:**

- Charge the handheld computer. If the battery status light does not turn on, remove the battery from the handheld computer and place it in the cradle. Once the battery is fully charged, reinsert it in the handheld computer.

- Make sure that the battery cover is well closed.
- Check if the Hold Switch on the left side of the unit is in unlocked position (up).
• Perform a Soft Reset.

• If the Soft Reset does not work, try a Hard Reset. A hard reset will clear all user-installed settings, applications, and data from RAM (Random Access Memory). It is important to transfer all important data on a personal computer before performing the hard Reset.

  - Press and hold the Calendar and Contacts shortcut buttons on your SoMo 650.

  - While holding the two buttons, using the tip of your stylus, lightly press the Reset button inside the hole on the bottom of your SoMo 650. Release the Calendar and Contacts shortcut buttons.

Press the two shortcut buttons with the index and middle finger of one hand. Hold the stylus in your other hand to press the reset button and then release.
- A Socket Splash Screen will appear and disappear.

- If the handheld computer does not turn on after the *Hard Reset*, the unit’s backup battery will need to be fully discharged to restore de SoMo to its original condition.
  - Remove the main battery and all AC power.
  - Wait for one hour.
  - After one hour, reinsert the main battery in the handheld computer. Make sure to slide the battery cover into place correctly.
  - Charge the handheld computer for a minimum of 4 hours before using it again.

**Problem:**

The battery of the handheld computer seems to discharge more quickly than usual.

**Solution:**

- Make sure that the Wi-Fi option is not available on the handheld computer. This option increases the power consumption resulting in a short battery life.

![Click on Wi-Fi icon](image1)
![Click on Wi-Fi bar](image2)
![Wi-Fi is now off](image3)
17.2 Errors during the measuring process

➤ **Problem:**

After initialization, the readings seem to be unstable.

![Image of meter readings]

✔ **Solutions:**

- As mentioned in the **Warnings** on the first page of this manual, it is highly recommended that you leave the probe ON for one hour before taking the first measures.
- If it is impossible to wait for one hour before taking measurement, re-initialize the probe frequently (see **Section 10.3 – Re-Initialization**).

➤ **Problem:**

The message **No Communication** appears during measuring process.

![Image of meter reading showing no communication]
✓ **Solutions:**

- Move away the probe from any conductive or magnetic material (point it in the air) and try to initialize the probe again by clicking on the **No Communication** message.

- If the **No Communication** message still remains on the screen, check if the **Cable / Wireless / Prog.** switch or the ON/OFF switch were not moved accidentally.

- Check if AA batteries are sufficiently charged. It is important to pay attention to the screen of the handheld computer. Some messages can appear. The **PROBE LOW BAT** message means that the probe batteries are sufficiently discharged to give erroneous readings. After a few seconds, if batteries are not replaced, the **No Communication** message appears. It is important to close the MPP software before turning the probe off.

➤ **Problem:**

The screen is **frozen**, nothing happens after a click, or the 📈 icon turns continuously for more than one minute.
Solution:

- If the icon turns continuously after clicking on File Creation (Section 10.4), this is normal. A correct file creation may take several minutes.

- When the handheld computer seems to be frozen, just press the little Reset button. This problem occurs when the probe will be turned off before closing of the MPP software.

- Remove the battery from the handheld computer for a few seconds.

If none of these solutions suggested in the Section 18 – Troubleshooting can resolve your problem, contact Instrumentation GDD – Technical Support (see Section 19 – Technical Support).
17.3 Bluetooth Partnership

To avoid wasting time on searching for Bluetooth devices, a Bluetooth partnership must be established between the handheld computer and the MPP probe before connecting. **This partnership was set up by GDD before the unit was sent out.** However, it is possible that you might have to reconfigure it and here are the instructions:

1. Turn on the MPP probe and place the **Cable/Wireless** switch in Wireless position.
2. Turn on the Socket Somo PC.
3. Click on Bluetooth icon.
4. Make sure that the Bluetooth is Visible. If not, click on Bluetooth bar to turn it Visible.
5. Click on Menu.

6. Click on Bluetooth Settings.

7. Select Devices.
8. Click on Add new device...

9. The program will search for Bluetooth Devices. This step may take few seconds.
10. Select the MPP’s name (MPXXXX) and click on Next.

11. Type 1234 for the Passcode

12. Click on Connect
13. Check Serial Port and click Save.

15. Click on New Outgoing Port.
16. Select your MPP’s name and click on Next.

17. Open the port menu.

18. Select COM8 and click Finish.
19. The name of your MPP should appear with the COM8 tag. Click on Ok button to close the window.

20. Click on the X button to close the Bluetooth Settings.

21. The connection between the Somo PDA and the MPP probe is now possible via Bluetooth operating mode.
18. Technical Support

If you encounter a problem not described in this manual, do not hesitate to contact Instrumentation GDD Inc. for help at:

Telephone: +1(418) 877-4249
Fax: +1(418) 877-4054
Toll free line: 1-877-977-4249 (in Canada)
E-Mail: support-technique@gdd.ca

Emergency out of business hours:

Pierre Gaucher
Home phone: +1 (418) 657-5870
Cell phone: +1 (418) 261-5552

Régis Desbiens
Home phone: +1 (418) 658-8539
Cell phone: +1 (418) 570-3408

Any GDD MPP probe that breaks down while under warranty or service will be replaced free of charge upon request for the duration of repairs, subject to instruments availability, except for shipping charges. This service is subject to instrument availability but we have been able to honour this commitment up to present.

</tbody>
</table>

With the default settings, the readings are equally distributed between two stamped marks (the REPARTITION box in the MEMORY page of the MPP Program is checked) in the continuous mode. That is why it is important to move the probe with a constant speed along the core sample. If you unchecked the REPARTITION box, the word AUTO will appear instead of the position. In manual mode, checking Repartition box will cause erroneous positions.

In this dumped file, the ? symbol (SYM) means that the probe cannot measure the magnetic susceptibility and the conductivity accurately. This problem occurs when the values are too low (around zero).
